

CSC471 Lab 1 report by Alex Cooper

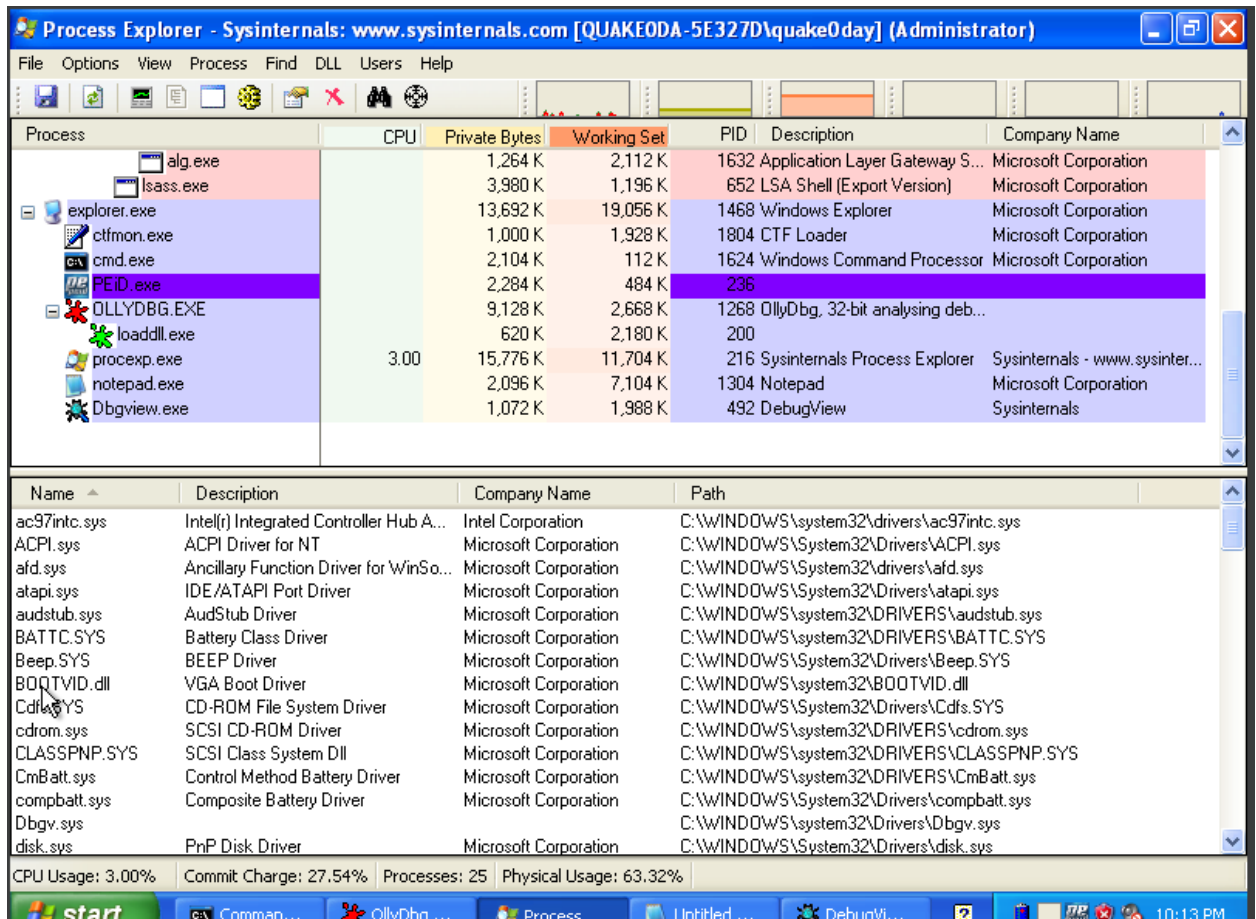

The first lab of the Spring 26 semester for CSC471 followed early ideas taught in class revolving around DLL injection and usage of debugging tools of the windows xp environment. This lab report will detail the steps taken to complete the task “Change the debug information in DebugView window from Injection!!! – CSC 497/583– Si Chen to Hello World! – XXX (Replace “XXX” with your name :)”.

The first 5 recommended steps revolve around installation of the environment, opening the environment via VirtualBox and getting the required files from D2L. The screenshot below should verify my ability to carry out these steps. Here I also navigate the proper file directory to verify the files are available. At the bottom of the screenshot, you will see all the required programs are open including notepad.

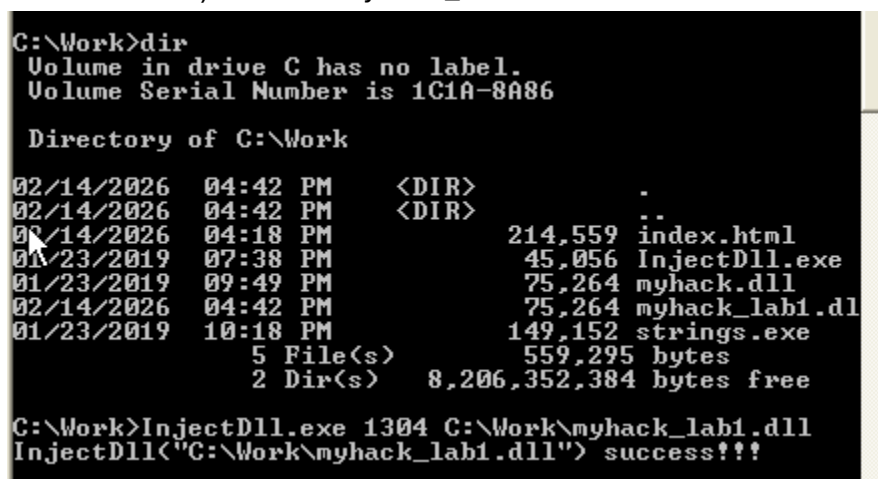

[illegible]

From here we continue through the demo by locating the process ID or PID of the running notepad using the process explorer.

With the PID located we can now use the command “InjectDll.exe PID (in our case 1304) C:\work\myhack_lab1.dll” and we receive confirmation of success.

We complete the lab by accessing the debug view where we can see a test run of the lab followed by the actual lab output “HELLO WORLD! -Alex”.
